

Delivering the payment security your customers deserve — every moment, every day

Keeping your payments environment optimized and secure is more challenging than ever. As payment fraud, money laundering and cyber-attacks grow more sophisticated, you need a solution that not only defends against today's threats but stays one step ahead of future risks.

INETCO BullzAI's real-time fraud detection and prevention capabilities help you maximize the security of digital transactions, stay compliant and protect your customers from evolving financial crimes — all without compromising the user experience.

Essential protection and compliance for next-level payments reliability

Trusted by financial institutions and payment service providers worldwide, INETCO BullzAI leverages advanced AI and real-time transaction monitoring to detect and prevent payment fraud, money laundering and cyber-attacks with unmatched speed and precision. Get ready to outsmart fraudsters, minimize false positives and block emerging AI-driven attacks in milliseconds with powerful visibility into every payment transaction, end-to-end.

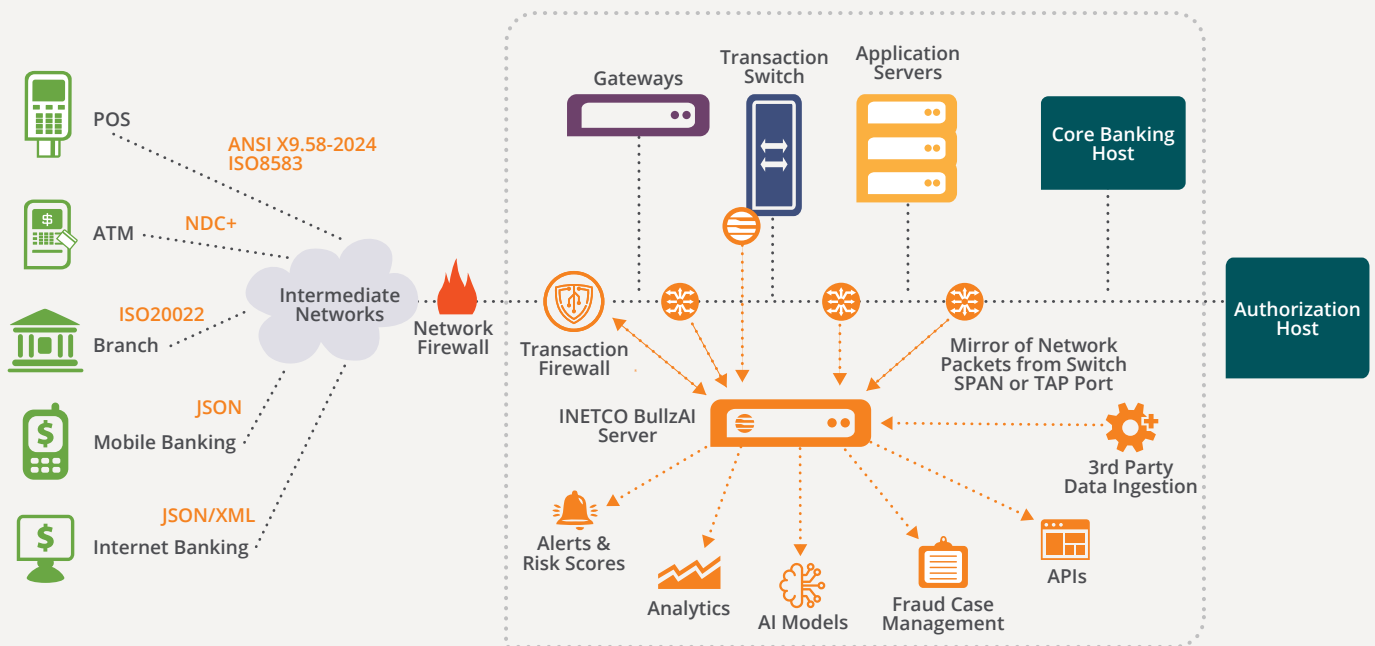

DIAGRAM: INETCO BullzAI captures, decodes and correlates in-flight transactions to detect and prevent payment fraud, money laundering and cyber-attacks in real-time. Spot unusual transaction patterns, path deviations, message manipulation and compromised systems before the damage is done.

Increased protection against payment fraud, money laundering and cyber threats including:

- Identity theft and account takeovers
- Card skimming and cloning
- Payment fraud (transaction reversals, injection attacks, fake transactions, cash-out scams, field message tampering)
- Malware attacks (man-in-the-middle)
- Internal fraud (fund transfers, transaction message adulteration, remote malware distribution and control)
- Cyber-attacks (BIN attacks, botnet attacks, rogue terminal attacks, credential stuffing, DDoS)
- Anti-money laundering violations (illegitimate onboarding, cross-border activities, money mules)

DETECT threats other systems can't with real-time transaction monitoring

- **Deliver a safer, undisrupted customer experience** by monitoring every in-flight transaction across every payment rail — without end-point integration or added latency
- **Unlock real-time access to deeper data insights** that include TCP/IP network data, fully decoded payload intelligence, metadata, response and request timings for every transaction
- **Simplify collaboration between internal fraud and AML teams** with reduced data silos and seamless integration of KYC/CDD data, watchlists and sanctions, and suspicious activity monitoring

PREVENT new attacks with advanced AI and self-training models

- **Reduce false positives** with real-time training of risk scoring models — no data science or IT resources required
- **Conduct unbiased behavioral analysis** by moving beyond a traditional population-based approach and profiling individual card, customer account and device/terminal activity
- **Increase efficiency of analyst investigations** with automated fraud case management workflows and AI-assigned risk advice/action

SHIELD your customers with transaction-level precision blocking

- **Neutralize new threat patterns and fraud tactics** with independent real-time rate-limiting or blocking at the transaction field level — not the IP or port level
- **Proactively prevent fraud** by recognizing, evaluating and stopping suspicious, out-of-character or high-risk activities before they lead to loss — without impacting legitimate transactions
- **Future-proof your fraud and compliance strategy** by combining patented real-time transaction monitoring and an AI-powered transaction firewall to shield from attacks traditional solutions can't detect

Ready to eliminate today's risks before they become tomorrow's losses?
